pr d(G-dA)n(dG-dT)n - using novel nucleic acid mols. as primers

Claim 1; Column 13-14; 186pp; English.

PS Claim 1; Column 13-14; 186pp; English.

CC having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic

CC markers. Primers based on these sequences can be used to detect these

CC repeats, especially for use in e.g paternity or maternity testing,

CC human genetic analysis such as inhage analysis of genetic disease,

CC commercial animal or plant breeding or pedigree analysis. Clones

CC containing the repeat sequences were isolated by hybridisation of

CC chromosome-specific phage libraries with a synthetic poly(GC-dA).(dG-dT)

probe. Over 100 repeat blocks were isolated. The inserts from the clones

CC probe. Over 100 repeat blocks were isolated. The inserts from the clones

CC were amplified by primers T65798-T66047. Those clones where the repeat

Sequence has been determined are shown in T65704-797. This repeat

CC sequence having the formula: (AC)19AA(AC)5A.

Sequence 51 BP; 27 A; 24 C; 0 G; 0 U;
gene mapping, and selective breeding
Table 7; Page 301; 517pp; English.
The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine MboI DNA fragments of between
screening a library of bovine MboI DNA fragments of between
conclusion of the corosatellites and a (TC)15 oligonucleotide probe.
Cone out of 50 clones cross-hybridised. Assuming independent
distribution of microsatellites and MboI sites, the frequency of
(T6)n >9 microsatellites in the bovine genome is estimated at >100,
CON The sequence information for ca. 230 such bovine microsatellites
is summarised in the specification and indexed herein (see below).
The sequences upstream and downstream of the microsatellite sequence
were used to generate the required PCR primers for in vitro
applification of the corresp. microsatellite (using the program
optipram). The microsatellites may be used to identify individuals,
Cor parentage testing, and in the genetic mapping of economic trait
coloci, or genes involved the determinism of economically important
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

PT Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding gene mapping, and selective breeding property of the sequence 15 that of a bovine microsatellite sequence obtd. by CC Streening a library of bovine mbor DNA fragments of between CC one out of 50 clones cross-hybridised. Assuming independent CC distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, CC one in the sequence information for ca. 230 such bovine microsatellites compared to the sequence of in the specification and indexed herein (see below).

CC office sequences upstream and downstream of the microsatellite sequence ware used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program CC oppirrin). The microsatellites may be used to identify individuals, CC inci, or genes involved the determinism of economic trait craits esp. in cattle, to allow selective breeding.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PT Polymorphic bowlne DNA markers - used in genetic identification, proper gene mapping, and selective breeding stable 7; Page 261; 517pp; English.

CC The sequence is that of a bowlne microsatellite sequence obtd. by cc screening a library of bowlne microsatellite sequence occ 250 and 500 bp with an (AC)15 and a (TC)15 oligonucjectide probe. CC cone out of 50 clones cross-hybridised. Assuming independent cc distribution of microsatellites and MboI sites, the frequency of cc (T6)n >9 microsatellites in the bowlne genome is estimated at >100, cc is summarised in the specification and indexed herein (see below). CC The sequences upstream and downstream of the microsatellites commarised in the specification and indexed herein (see below). CC me used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program CC opTiPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait cc corresp. In cattle, to allow selective breeding.

CC Table 7; Page 311; 517pp; English.

CC Screening a library of bovine MboI DNA fragments of between

CC 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.

CC 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.

CC One out of 50 clones cross-typbridised. Assuming independent

CC (T6)n >9 microsatellites in the bovine genome is estimated at >100,

CC (T6)n >9 microsatellites in the bovine genome is estimated at >100,

CC OND The sequence information for ca. 230 such bovine microsatellites

CC is summarised in the specification and indexed herein (see below).

CC The sequences upstream and downstream of the microsatellite sequence

CC were used to generate the required PCR primers for in vitro

CC amplification of the corresp. microsatellite (using the program

CC oppiprixib). The microsatellites may be used to identify individuals,

CC of the sequence in the program and in the meanting of economic traiting traits.

pr gene mapping, and selective breeding
Table 7: Page 347: 517pp; English.

Che sequence is that of a bowine microsatellite sequence obtd. by
Cs creening a library of bowine MooI DNA fragments of between
Cs one out of 500 pb with an (AC)15 and a (TC)15 oligonucleotide probe.
Cc one out of 50 clones cross-hybridised. Assuming independent
Cc one out of 50 clones cross-hybridised. Assuming independent
Cc of the sequence information for ca. 230 such bowine microsatellites in the bowine genome is estimated at >100,
Cc of the sequence information for ca. 30 such bowine microsatellites
Cc is summarised in the specification and indexed herein (see below).
Cc the sequences upstream and downstream of the microsatellite sequence
Cc amplification of the corresp. microsatellite (using the program
Cc opTIPRIM). The microsatellites may be used to identify individuals,
Cc of arentage testing, and in the genetic mapping of economic trait
Cc loci, or genes involved the determinism of economically important
Cc traits esp. in cattle, to allow selective breeding.

Table 7: Page 402; 517pp; English.

CC The sequence is a boyine microsatellite sequence obtd. by
CS screening a library of boyine Morosatellite sequence of between
CS 30 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.
CC one out of 50 clones cross-hybridised. Assuming independent
CS of increased littles in the boyine genome is estimated at >100,
CC (Moin >9 microsatellites in the boyine genome is estimated at >100,
CC (Moin >9 microsatellites in the boyine genome is estimated at >100,
CC (Moin >9 microsatellites in the boyine genome is estimated at >100,
CC (Moin >9 microsatellites in the boyine genome is estimated at >100,
CC (Moin >9 microsatellites may be used howine microsatellites

PI polymorphic bovine DNA markers - used in genetic identification, properly gene mapping, and selective breeding properly gene mapping, and selective breeding properly gene mapping, and selective breeding properly gene mapping, and selective broine microsatellite sequence obtd. by creaming a library of bovine mboi DNA fragments of between concept of 50 clones cross-hybridised. Assuming independent concept of 50 clones cross-hybridised. Assuming independent concept of microsatellites and Mboi sites, the frequency of concept of microsatellites and Mboi sites, the frequency of concept of microsatellites and Mboi sites, the frequency of concept of microsatellites and mboi sites, the frequency of concept of microsatellites and mboi sites, the frequency of concept of microsatellites and mboi sites, the frequency of concept of microsatellites and more sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below).

The sequences upstream and downstream of the microsatellite sequence concept in the corresp. microsatellite (using the program concept concept testing, and in the genetic mapping of economic trait concipt of genes involved the determinism of economically important concept concept concept of the cattle, to allow selective breeding.

PT (dC-dA)n(dG-dr)n - usiny nover nuclear (dC-dA)n(dG-dr)n (dG-dr)n (dG-dr)n (dG-dr)n which can be used as genetic CC The invention relates to the isolation of polymorphic repeat sequences CC The invention relates to the isolation of polymorphic repeat sequences CC markers. Primers based on these sequences can be used to detect these commarcial animal for use in e.g paternity or maternity testing, CC human genetic analysis such as linkage analysis of genetic disease, CC commercial animal or plant breeding or pedigree analysis.

CC The repeats, when analysed, fall into 4 categories:

CC The repeats which are alternating tandem CA repeats with no cc interruptions and without adjacent repeats of more runs of uninterrupted CC A repeats which are defined as 2 or more runs of uninterrupted CC 2) imperfect repeats which are defined as 2 or more runs of CA separated CC y interrupted dinucleotide or longer repeat bases from a run of at least CC uninterrupted dinucleotide or longer repeats of a sequence other than CC (dC-dA)n.(dG-dT)n, or from at least 10 uninterrupted mononucleotides; and CC ompound repeats except that the runs of CA are interrupted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            888888888888888888

CC The invention relates to the isolation of polymorphic repeat sequences

CC having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic

CC markers. Primers based on these sequences can be used to detect these

CC repeats, especially for use in e.g paternity or maternity testing,

CC human genetic analysis such as linkage analysis of genetic disease,

CC commercial animal or plant bereeding or pedigree analysis. Clones

CC containing the repeat sequences were isolated by hybridisation of

CC probe. Over 100 repeat blocks were isolated. The inserts from the clones

CC were amplified by primers 765798-766047. Those clones where the repeat

CC sequence has been determined are shown in 765704-797. This repeat

CC sequence is from the marker clone Mdf30 which contains the repeat

CC sequence as from the formula: (AC)185.

Sequence 37 BP; 19 A; 18 C; 0 G; 0 U;

DR Detection of polymorphic genetic markers of the form PT (dC-dA)n(dG-dT)n - using novel nucleic acid mols. as primers PT (dC-dA)n(dG-dT)n - using novel nucleic acid mols. as primers PT (dC-dA)n(dG-dT)n + 1-12; 186pp; English.

PS Disclosure; Column 11-12; 186pp; English.

CC having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic CC markers. Primers based on these sequences can be used to detect these CC commercial primers based on these sequences can be used to detect these CC commercial animal or plant breeding or paternity or maternity testing, CC commercial animal or plant breeding or pedigree analysis of genetic disease, CC containing the repeat sequences were isolated by hybridisation of CC chromosome-specific phage libraries with a synthetic poly(dC-dA).(dG-dT) CC corosome-specific phage libraries with a synthetic poly(dC-dA).(dG-dT) CC corosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) CC corosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) CC corosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) CC corosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) CC corosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) CC corosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) CC sequence has been determined are shown in T65704-797. This repeat CC sequence is from the marker clone Mdf50 which contains the repeat CC sequence 38 BP; 19 A; 19 C; 0 G; 0 U;
                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

Table 7; Page 189; 517pp; English.

The sequence is that of a bovine microsatellite sequence obtd. by creening a library of bovine mbor DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.

Cone out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbor sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, clones from the bovine genome is estimated at >100, clones from the sequence information for ca. 20 such bovine microsatellites is summarised in the specification and indexed herein (see below).

The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program of the microsatellites and the specific mapping of economic trait of premers for in vitro appropriate testing, and in the genetic mapping of economic trait traits esp. in cattle, to allow selective breeding.

                                                                                                                                                                                                                                                                                                                                     gene mapping, and selective breeding general appling and selective breeding general appling, and selective breeding. The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between cone out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, cone out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, cone out of 50 clones cross-hybridised. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellites expenses the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program opripring). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait traits esp. in cattle, to allow selective breeding. Lehrman, M.A., Goldstein, J.L., Russell, D.W. and Brown, M.S.
Duplication of seven exons in LDL receptor gene caused by Alu-Alu recombination in a subject with familial hypercholesterolemia Cell 48 (5), 827-835 (1987)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ch 0.1%; l similarity 100.0%; 44; Conservative (
                                                                                                                                                                                                                                                                                                                               Clean copy of sequence kindly provided by M.Lehrman (22-APR-1987). Individual FH 295 carries two mutant LDL receptor alleles. The allele below was inherited from the father and includes a duplication of exons 2 through 8 that was presumably created by unequal chromosomal crossover involving Alu repeats in introns 1 and 8. The exact site of recombination cannot be determined because the sequences of the Alu repeats in introns 1 and 8 of normal alleles are identical over a span of 26 nucleotides at the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Homo sapiens

                                 /note-"vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; lst strand cDNA was prepared from 3 pooled germ cell tumors, and was then primed with a Not I oligo(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library is normalized. Library was constructed by Bento Soares and M. Fatima Bonaldo. "
